

HM DASH UPDATING DRIVERS

To install the drivers when you first connect the dash you need to have downloaded them from the website and extracted them to a known location such as your “Desktop” or “My Documents”. Then go in to your device manager and search for HM High Speed USB. This should be easily identifiable by a yellow triangle with an exclamation mark inside it.

Click on this and select DRIVER. Then click on upgrade or install.

Now select BROWSE and locate the extracted drivers on your Desktop or My Documents. Highlight the folder and click continue. You will receive a warning but this is perfectly safe to continue.

Once this has completed it will tell you they have been successfully installed.
